Addiction - Multinomial Model

February 1, 2012

```
First the "addiction" data are loaded and attached.
> library(catdata)
> data(addiction)
> attach(addiction)
   For the multinomial logit model the function "multinom" from the "nnet"-
package is used.
> library(nnet)
   The response "ill" has to be used as factor.
> ill <- as.factor(ill)</pre>
> addiction$ill<-as.factor(addiction$ill)</pre>
   The first model is a model with the covariates "gender", "university" and a
linear effect of "age"
> multinom0 <- multinom(ill ~ gender + age + university, data=addiction)
# weights: 15 (8 variable)
initial value 749.253581
iter 10 value 675.937605
final value 675.208456
converged
> summary(multinom0)
Call:
multinom(formula = ill ~ gender + age + university, data = addiction)
Coefficients:
  (Intercept)
                 gender
                                 age university
   -1.160717 0.4366061 0.02991096 1.622052
   -2.015571 0.2879080 0.04208660
                                       1.067295
Std. Errors:
  (Intercept)
                gender
                                  age university
    0.2654366 0.1938408 0.006235135 0.2534615
    0.3076299 0.2207805 0.006821200 0.2891136
Residual Deviance: 1350.417
```

AIC: 1366.417

```
Another possibility to fit multinomial response models is given by the function "vglm" from the package "VGAM".
```

```
> library(VGAM)
> multivgam0<-vglm(ill ~ gender + age + university, multinomial(refLevel=1), data=addictio
> summary(multivgam0)
Call:
vglm(formula = ill ~ gender + age + university, family = multinomial(refLevel = 1),
    data = addiction)
Pearson Residuals:
                       Min
                                 1Q
                                     Median
                                                   3Q
log(mu[,2]/mu[,1]) -4.4464 -0.83311 -0.41954 0.99377 1.5516
log(mu[,3]/mu[,1]) -4.2426 -0.55806 -0.27917 -0.18371 2.4954
Coefficients:
                  Value Std. Error t value
(Intercept):1 -1.160714 0.2654346 -4.3729
(Intercept):2 -2.015564 0.3076272 -6.5520
gender:1
              0.436607 0.1938397

              -0.0018918 0.00033580 -5.6336
age2:2
             -0.0011739 0.00033989 -3.4539
Number of linear predictors: 2
Names of linear predictors: log(mu[,2]/mu[,1]), log(mu[,3]/mu[,1])
Dispersion Parameter for multinomial family:
```

Residual Deviance: 1317.75 on 1354 degrees of freedom

```
Log-likelihood: -658.8752 on 1354 degrees of freedom
```

Number of Iterations: 4

It should be noted that the standard errors for the models generated by "nnet" and "VGAM" differ when age is included quadratically. The parameter estimates are equal again.

Now the necessity of the quadratic term is tested by using the function "anova".

```
> anova(multinom0,multinom1)
```

Likelihood ratio tests of Multinomial Models

```
Response: ill
```

```
Model Resid. df Resid. Dev Test Df LR stat.

1 gender + age + university 1356 1350.417

2 gender + age + university + age2 1354 1317.750 1 vs 2 2 32.66659
Pr(Chi)

1 2 8.063801e-08

> multinom1$dev - multinom0$dev

[1] -32.66659
```

Now we plot the probabilities for the responses against age. First a sequence within the range of age has to be created.

```
> minage <- min(na.omit(age))
> maxage <- max(na.omit(age))
> ageindex <- seq(minage, maxage, 0.1)
> n <- length(ageindex)</pre>
```

Now the vectors for the other covariates and the data sets for men and women are built.

```
> ageindex2 <- ageindex^2
> gender1 <- rep(1, n)
> gender0 <- rep(0, n)
> university1 <- rep(1, n)
> datamale <- as.data.frame(cbind(gender=gender0,age=ageindex,university=university1,age2=
> datafemale <- as.data.frame(cbind(gender=gender1,age=ageindex,university=university1,age2=</pre>
```

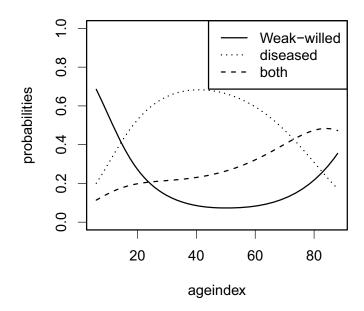

Now for the built data sets the probabilities based on model "multinom1" are computed.

```
> probsmale <- predict(multinom1, datamale, type="probs")
> probsfemale <- predict(multinom1, datafemale, type="probs")</pre>
```

Now the probabilities can be plotted.

- > par(cex=1.4, lwd=2)
- > plot(ageindex, probsmale[,1], type="l", lty=1, ylim=c(0,1), main="men with university defined by the content of the conte
- > lines(ageindex, probsmale[,2], lty="dotted")
- > lines(ageindex, probsmale[,3], lty="dashed")
- > legend("topright", legend=c("Weak-willed", "diseased", "both"), lty=c("solid", "dotted",

men with university degree

- > par(cex=1.4, lwd=2)
- > plot(ageindex, probsfemale[,1], type="l", lty=1, ylim=c(0,1), main="women with universit"
- > lines(ageindex, probsfemale[,2], lty="dotted")
- > lines(ageindex, probsfemale[,3], lty="dashed")
- > legend("topright", legend=c("Weak-willed", "diseased", "both"), lty=c("solid", "dotted",

women with university degree
