Birth Data - Bivariate Binary GEE

February 1, 2012

The Birth data are loaded.

```
> library(catdata)
> data(birth)
> attach(birth)
```

The original variable "Intensive" is converted into the binary variable "Intensive" indicating whether the child spent time in intensive care or not. In addition, "Previous" is reduced to 3 categories by merging two and more previous pregnancies to level "2".

```
> intensive <- rep(0,length(Intensive))
> intensive[Intensive>0] <- 1
> Intensive <- intensive
> previous <- Previous
> previous[previous>1] <- 2
> Previous <- previous
```

For the GEE the package "gee" will be used.

```
> library(gee)
```

For comparison again the binary regression model "bivarlogit" including odds ratios is fitted

```
> library(VGAM)
> Birth <- as.data.frame(na.omit(cbind(Intensive, Cesarean, Sex, Weight, Previous, AgeMoth
> detach(birth)
> bivarlogit <- vglm(cbind(Intensive , Cesarean) ~ Weight + AgeMother + as.factor(Sex) + a
> summary(bivarlogit)

Call:
vglm(formula = cbind(Intensive, Cesarean) ~ Weight + AgeMother +
    as.factor(Sex) + as.factor(Previous), family = binom2.or(zero = NULL),
    data = Birth)

Pearson Residuals:
                Min        1Q    Median        3Q      Max
logit(mu1)  -1.1892  -0.339340  -0.24901  -0.16355  10.8180
logit(mu2)  -1.3821  -0.523377  -0.41772  -0.24756   5.9127
log(oratio) -4.1883   0.032603   0.10362   0.16753  47.6346
```

```
Coefficients:

Number of linear predictors:  3

Names of linear predictors: logit(mu1), logit(mu2), log(oratio)

Dispersion Parameter for binom2.or family:    1

Residual Deviance: 1165.207 on 2304 degrees of freedom

Log-likelihood: -582.6033 on 2304 degrees of freedom

Number of Iterations: 8
```

To fit the bivariate GEE the covariates have to be created separately for both response variables.

```
> n <- dim(Birth)[1]
> ID <- rep(1:n,2)
> InterceptInt <- InterceptCes <- rep(1, 2*n)
> InterceptInt[(n+1):(2*n)] <- InterceptCes[1:n] <- 0
> AgeMotherInt <- AgeMotherCes <- rep(Birth$AgeMother,2)
> AgeMotherInt[(n+1):(2*n)] <- AgeMotherCes[1:n] <- 0
> SexInt <- SexCes <- rep(Birth$Sex,2)
> SexInt[SexInt==1] <- SexCes[SexCes==1] <- 0
> SexInt[SexInt==2] <- SexCes[SexCes==2] <- 1
> SexInt[(n+1):(2*n)] <- SexCes[1:n] <- 0
> PrevBase <- rep(Birth$Previous,2)
> PreviousInt1 <- PreviousCes1 <- PreviousInt2 <- PreviousCes2 <- rep(0, 2*n)
> PreviousInt1[PrevBase==1] <- PreviousCes1[PrevBase==1] <- 1
```

```
> PreviousInt2[PrevBase>=2] <- PreviousCes2[PrevBase>=2] <- 1
> PreviousInt1[(n+1):(2*n)] <- PreviousInt2[(n+1):(2*n)] <- PreviousCes1[1:n] <- PreviousC
> WeightInt <- WeightCes <- rep(Birth$Weight,2)
> WeightInt[(n+1):(2*n)] <- WeightCes[1:n] <- 0
```

The created covariates are collected in the data set "GeeDat" that will be used for the GEE.

```
> GeeDat <- as.data.frame(cbind(ID, InterceptInt, InterceptCes, SexInt , SexCes , WeightIn
+ PreviousCes1, PreviousCes2, AgeMotherInt , AgeMotherCes, Response=c(Birth$Intensive, Bir
```

Finally the GEE is fitted.

```
> gee1 <- gee (Response ~ -1 + InterceptInt + InterceptCes + WeightInt + WeightCes + AgeMo
+ PreviousInt1 + PreviousCes1 + PreviousInt2 + PreviousCes2,
+ family=binomial(link=logit), id=ID, data=GeeDat)
